

# Genomic perspectives on malaria in the Guiana Shield

AgiT Conference, Cayenne, French Guiana

Daniel Neafsey

October 17, 2024

Every mosquito, or drop of blood from a malaria-infected person, contains genetic information useful for effectively treating and eliminating malaria.

**This encoded information is increasingly straightforward to read.**

# Malaria molecular surveillance

Sample collection

DNA Testing

Data Analysis:

Local or

Resistance

time

Transmission levels

**Dr. Caroline Buckee**  
Professor, Dept. of  
Epidemiology, HSPH

# Role of malaria drug resistance surveillance in Guyana

- Difficult to implement therapeutic efficacy studies
- Difficult to track actual drug treatment in mobile miner population
- Continued volatility in resistance mutation frequencies (PPQ resistance mutations are now decreasing)

**Dr. Horace Cox**  
Head of Vector-borne Diseases  
CARPHA

**Dr. Reza Niles-Robin**  
Director of Vector Control  
Services,  
Guyana MoH

**Dr. Lise Musset**  
Group Leader  
IP Guyane

# Example: piperavaquine resistance mutations

*pfCRT* C350R GWAS hit for PPQ resistance

Angela Early (Broad)

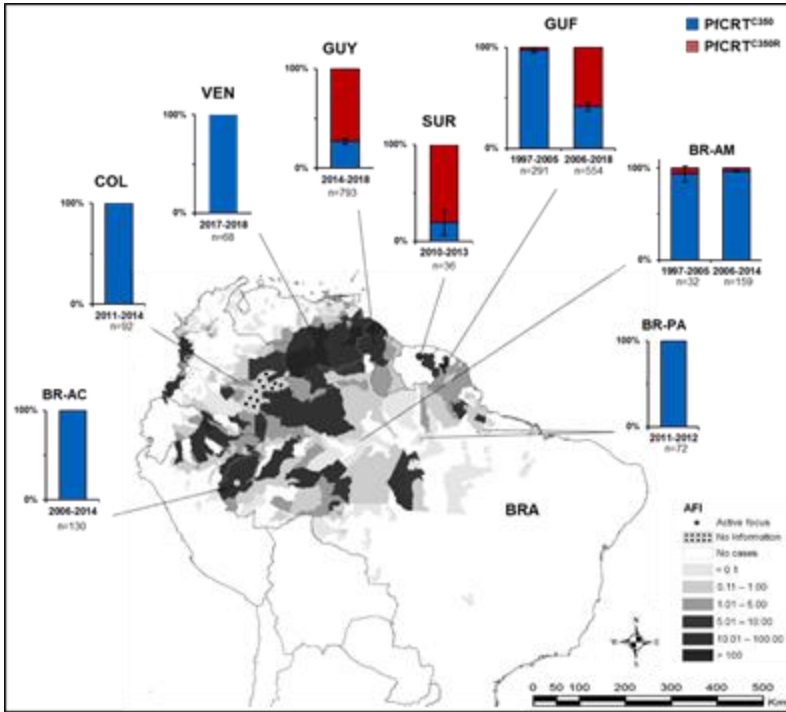

Lise Musset  
(Institut Pasteur de la Guyane)

Celia Florimond

Piperavaquine is the partner drug to the most common self-medication used by miners (DHA+PPQ+TMP)

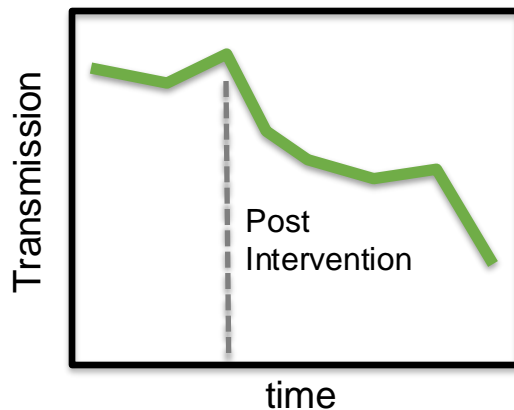

**Weakened piperavaquine partner drug efficacy could have allowed for emergence of the Kelch13 C580Y resistance mutation**

Florimond et al., 2023

# Measuring changes in transmission with genomic indicators

- Complementary to traditional epidemiological measures (case incidence, prevalence), especially when those are hard to measure
- Highly mobile populations are well suited (eg gold miners)

Dr. Maylis Douine, CHC

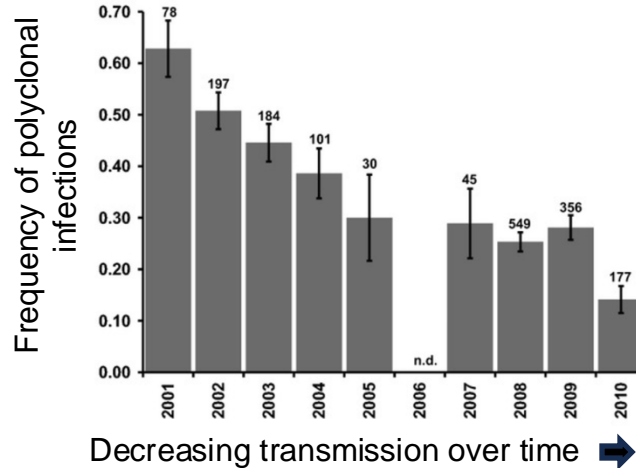

# Polyclonality reflects transmission intensity

Clonal infection  
(1 strain)

Polyclonal infection  
(3 strains)

Nkhoma et al. 2012

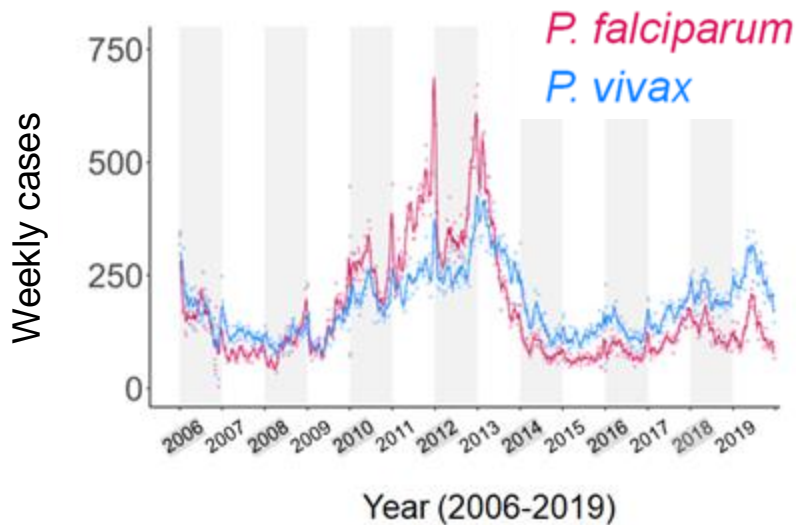

High Transmission  
High polyclonality

Low Transmission  
Low Polyclonality

# Comparing *P. falciparum* vs. *P. vivax* in Guyana

700 genomes from each species, matched over time and geography

Philipp Schwabl (HSPH)

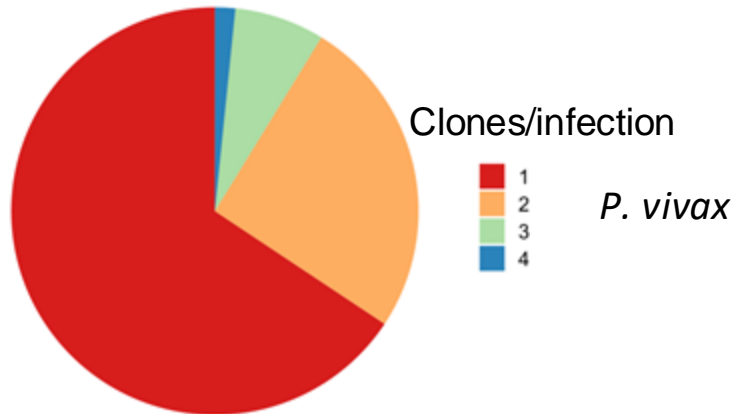

Flavia Camponovo (HSPH)

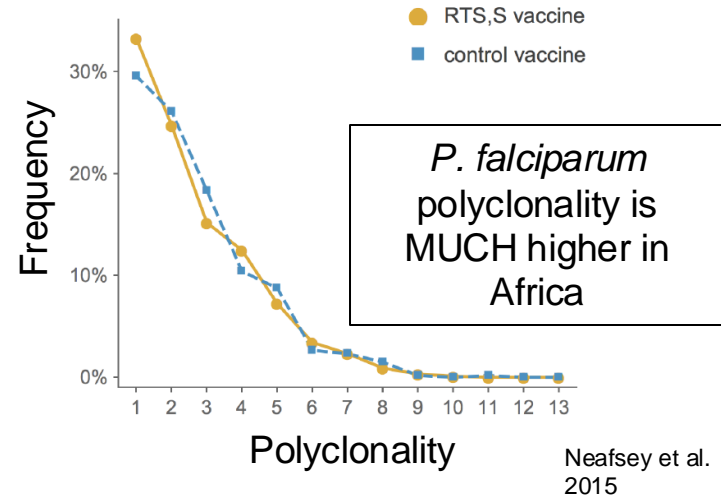

Reza Niles-Robin (Guyana MoH)

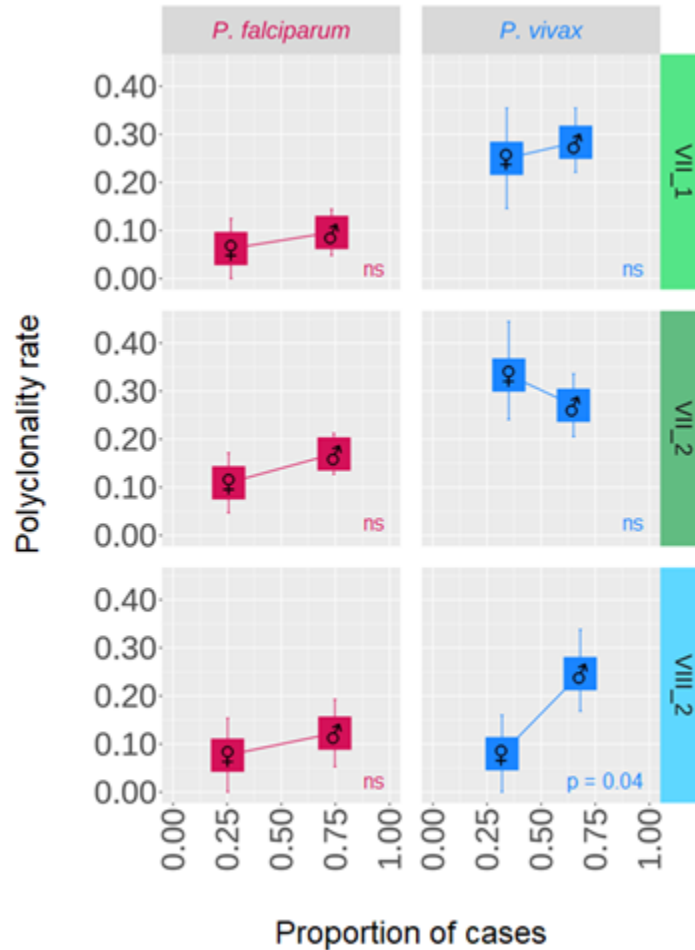

# Lower polyclonality within infections in Guyana for *P. falciparum* vs. *P. vivax*

**Hypothesis:** Lower *P. falciparum* transmission, as well as relapse of *P. vivax* infections, cause higher polyclonality in *P. vivax* infections

Polyclonal infections are typically more common in males than females for both parasite species

Polyclonality varies by geographic region in *P. vivax*

# Why do mosquito genomes matter for malaria?

*Vectors are evolutionarily dynamic.*

Understanding vectors is important for targeting effective control.

# Malaria elimination progress depends on effective drugs and insecticides

Malaria prevalence in African 2-10 year olds

# Disease transmission competence is a complex trait

- Biting behavior (time/location)
- Immunity
- Insecticide resistance
- Anthropophily (biting preference)
- Ecology

**Vectorial Competence**

# Changes in vectorial capacity happen quickly

Whole-genome  
consensus  
phylogeny

*An. gambiae*

*An. coluzzii*

*An. arabiensis*

*An. quadriannulatus*

*An. melas*

*An. merus*

C. Costantini

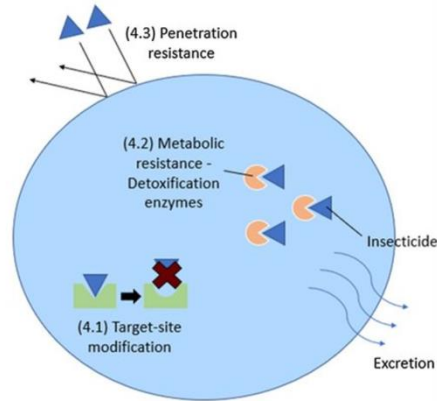

**All thought to be one species until the 1960s**

# Does *Anopheles darlingi* evolve like *Anopheles gambiae*?

*An. gambiae* complex  
*An. funestus* complex

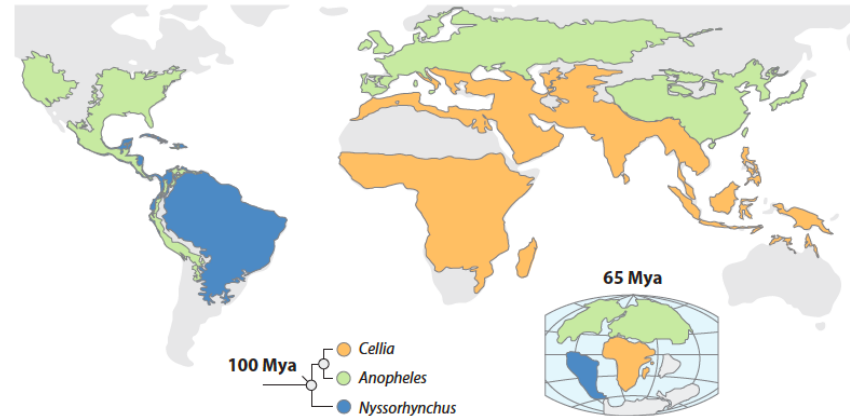

- Semi-isolated cryptic taxa
- High diversity partitioned into large inversions
- Target-site & metabolic insecticide resistance

Gan et al. 2021

*An. darlingi*

Molina-Cruz et al. 2016

# *Anopheles darlingi* sampling

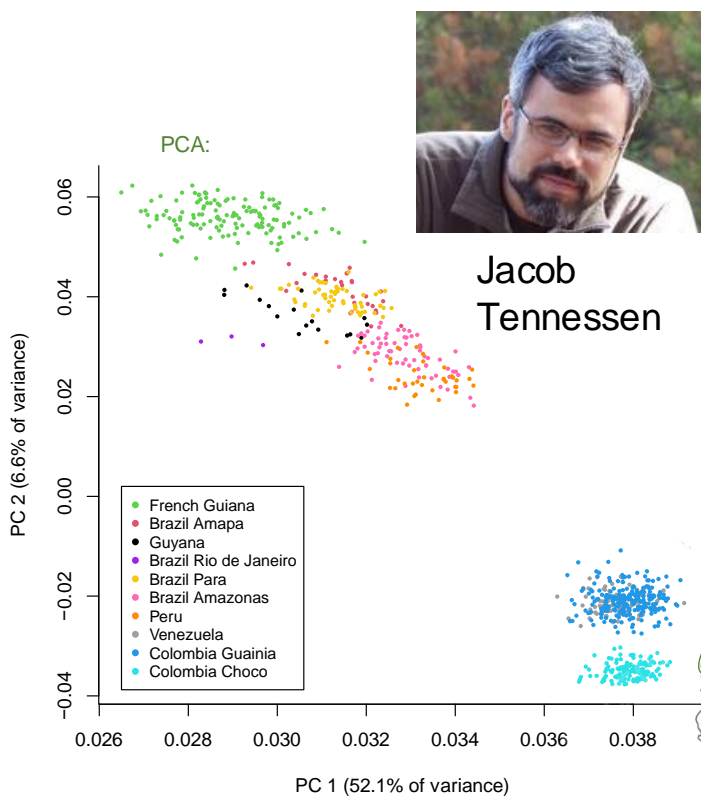

Collection:  
Mathilde Gendrin, Martha Quiñones, Jan Conn,  
Maria Eugenia Grillet, Maria Anice Mureb Sallum

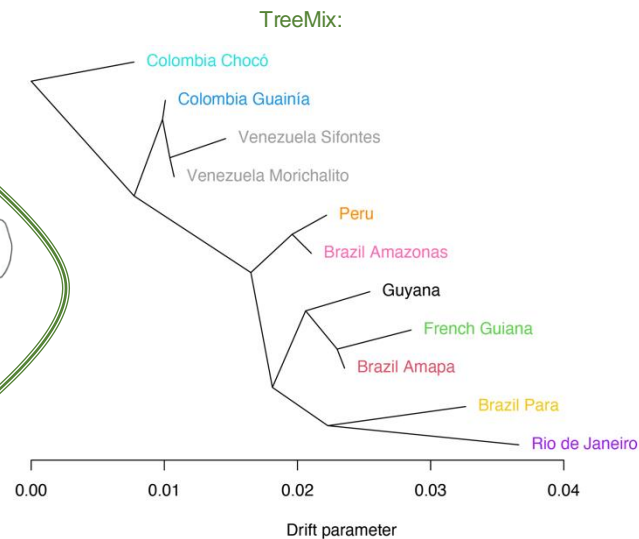

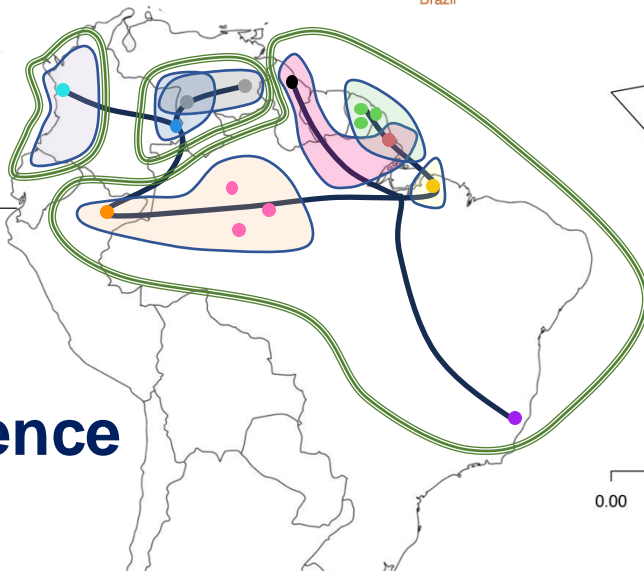

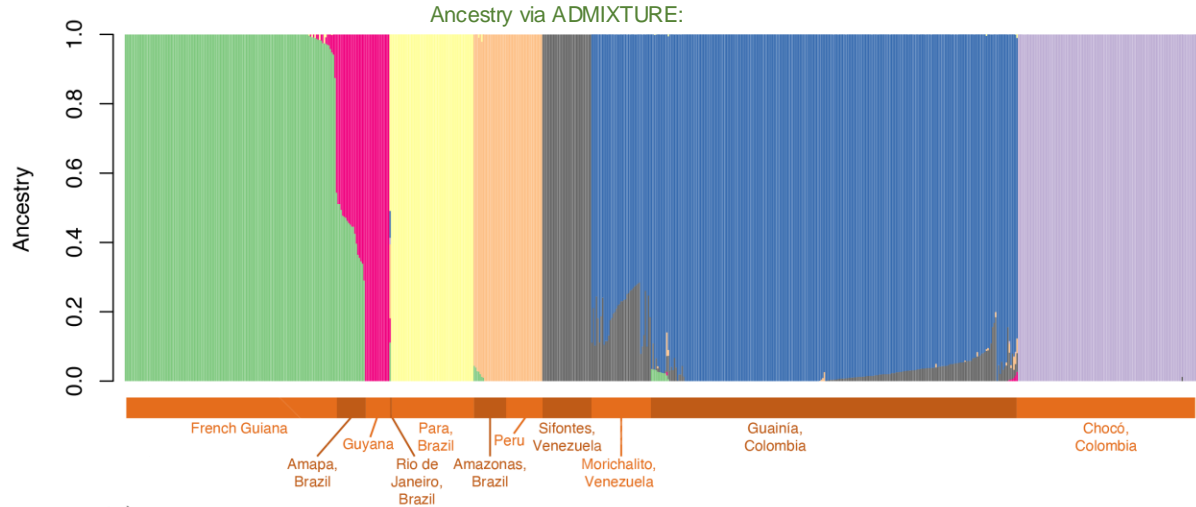

Country	Location	N	N ≥8×	Median Coverage
French Guiana	Blondin	73	73	42×
French Guiana	Cacao	39	39	44×
French Guiana	La Césarée	27	27	46×
Guyana	Georgetown	18	17	20×
Brazil	Calçoene	45	29	10×
Brazil	Peixe-Boi	63	59	17×
Brazil	Manacaparu	54	11	4×
Brazil	Barcelos	46	25	8×
Brazil	Coari	59	28	7×
Brazil	Juturnaiba	6	3	7×
Peru	Loreto	89	37	4×
Venezuela	Sifontes	77	35	7×
Venezuela	Morichalito	49	45	20×
Colombia	Guainía	265	244	33×
Colombia	Chocó	184	143	18×

Jacob Tennesen

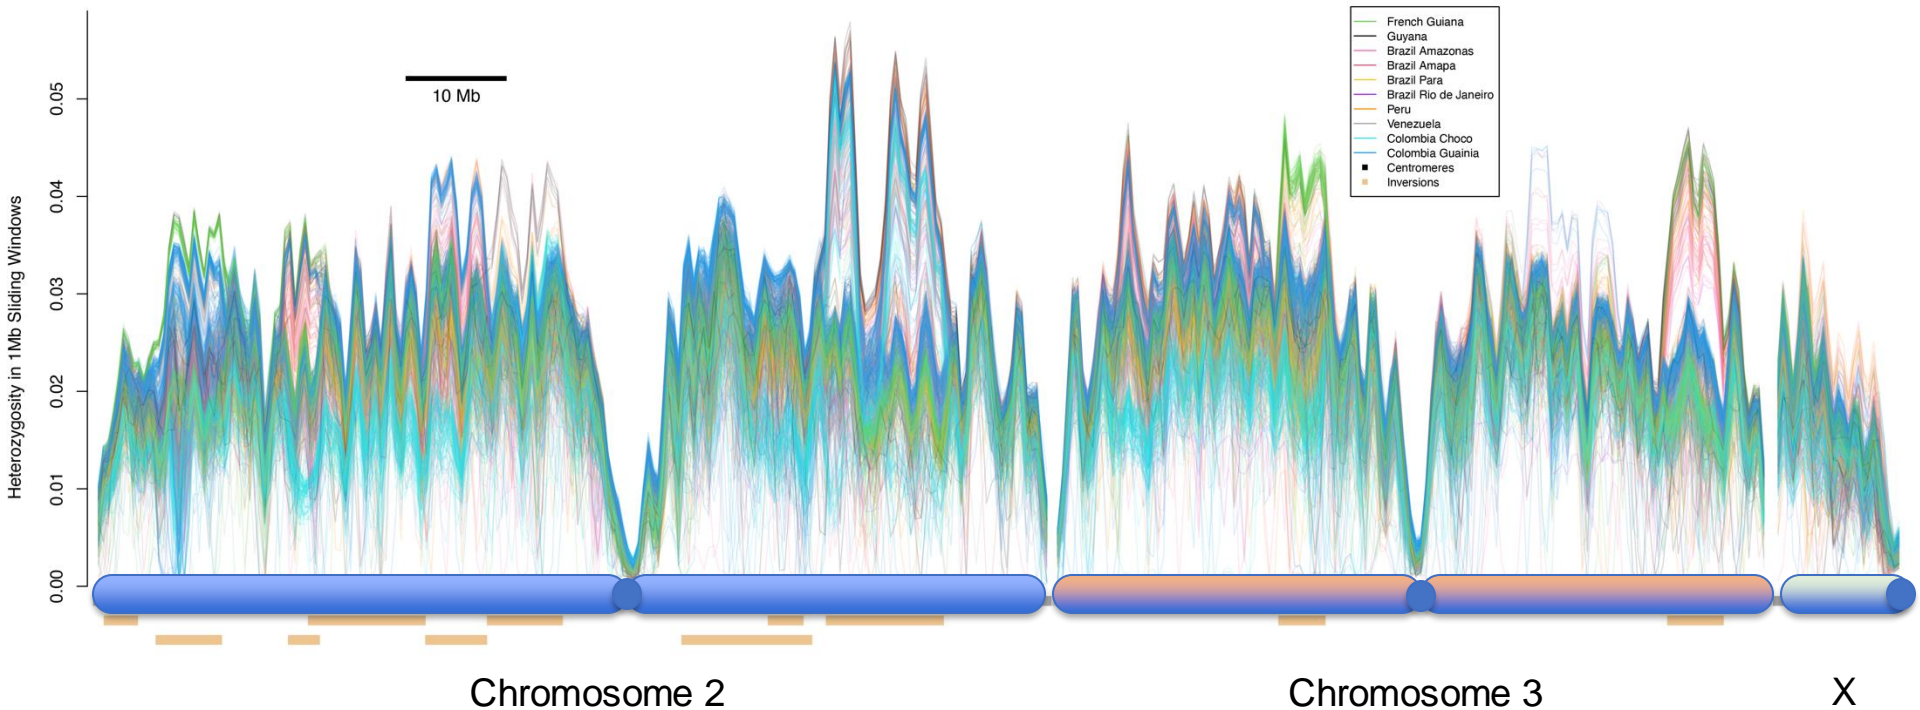

**Strong population structure (but no evidence of cryptic species)**

# Inversions suppress gene flow locally

niche  
specialization

# High genetic diversity across the genome, especially in inversions

# Detecting natural selection from genomic divergence

“genetic drift”  
(slow divergence)

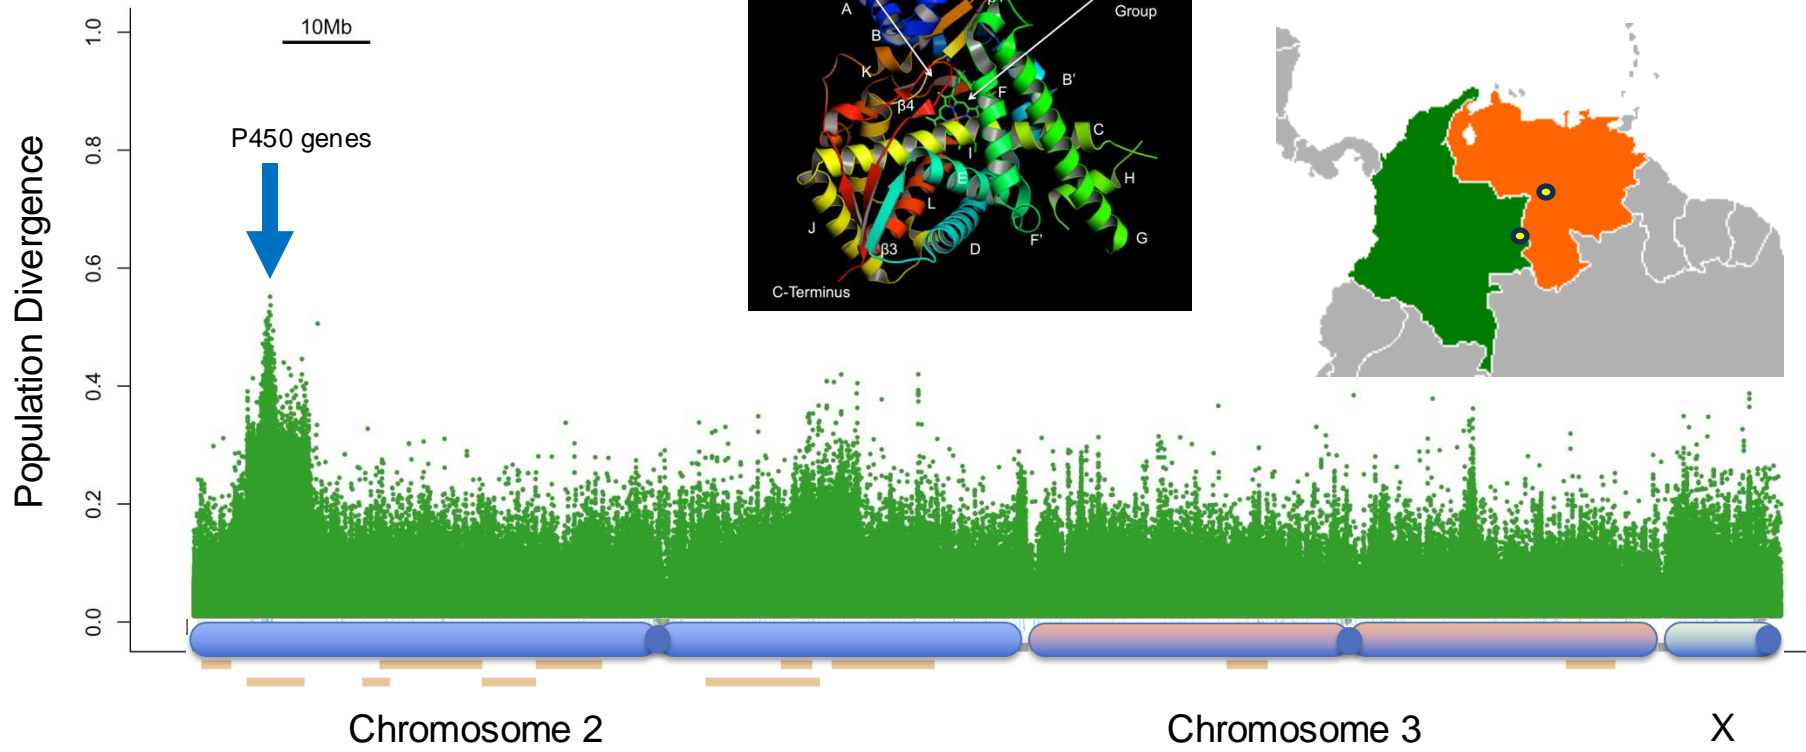

**FAST Divergence**

Often caused by  
natural selection

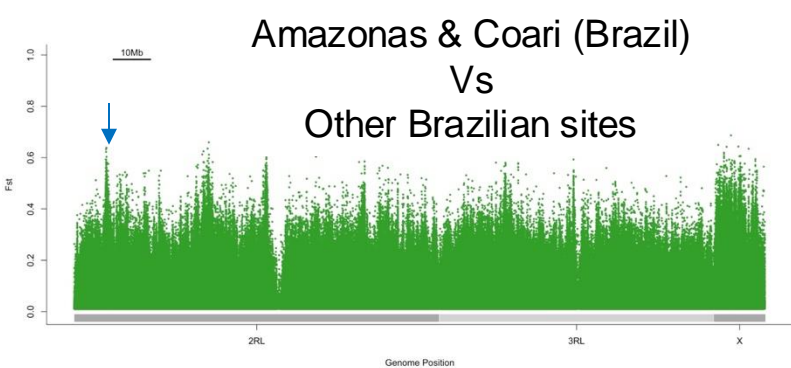

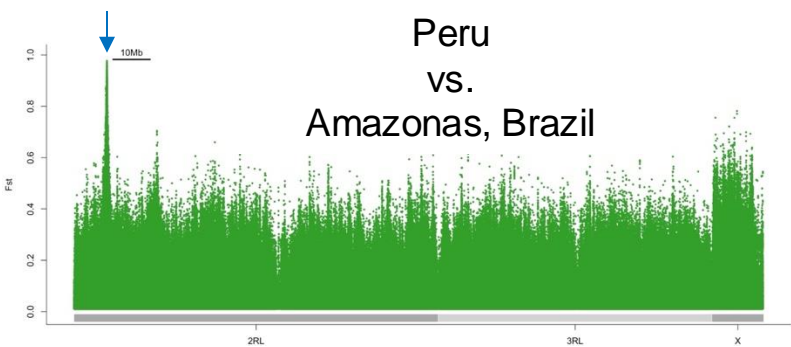

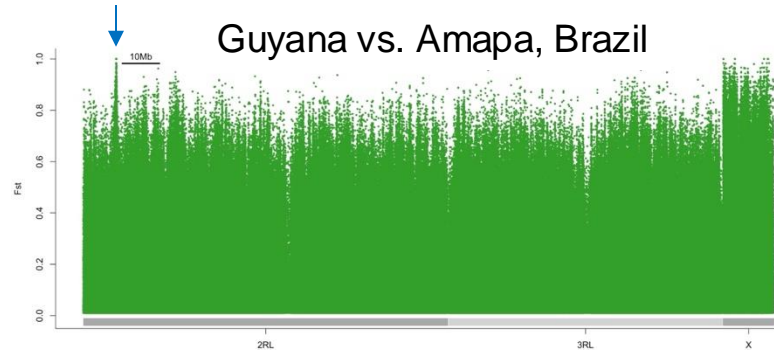

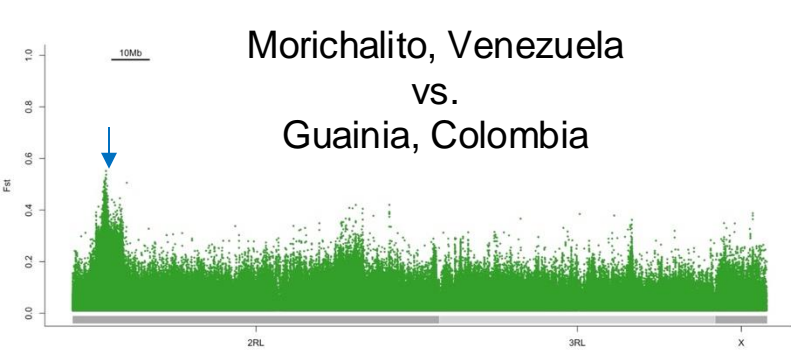

# Genomic divergence near a P450 gene cluster within inversion

Morichalito, Venezuela  
vs.  
Guainia, Colombia

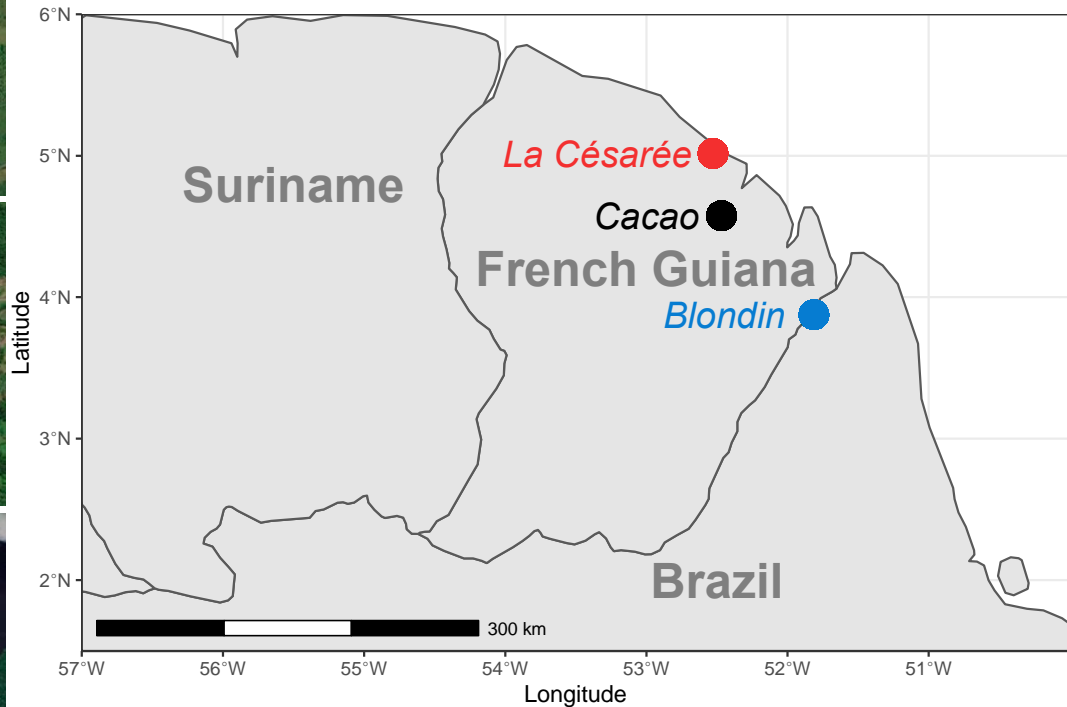

**Similar p450 selection signals in other populations**

**But, NO polymorphisms at insecticide target sites:**  
*vgsc* L995 (*kdr*)  
*rdl* A296  
*ace1* G280

# French Guiana: a clue to selection?

■ P450 gene  
■ Other gene

Thr-Lys in *CYP6AA1*  
 33% frequency in Cacao  
 0% frequency elsewhere

Position on chromosome 2RL

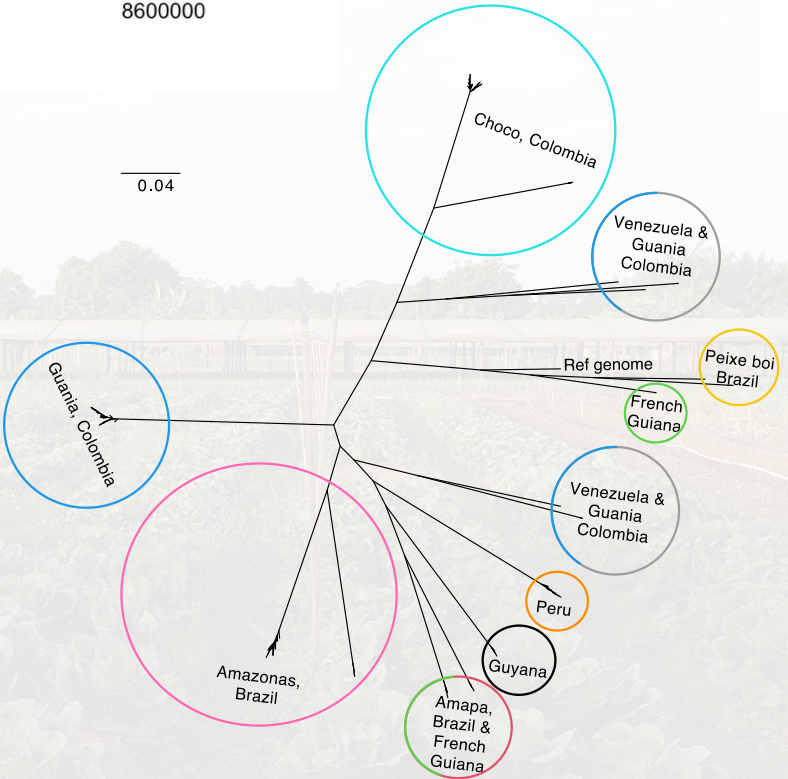

Jean-Bernard Duchemin

Cacao, French Guiana

**Insecticide resistance is evolving independently in localities across South America.**

# Summary

*An. gambiae* complex  
*An. funestus* complex

*An. darlingi*

Widespread across continent

Exceptionally high diversity

Large inversions

Sympatric cryptic taxa

Pop gen patterns driven by anthropophily

Target-site insecticide resistance

Metabolic insecticide resistance

GATES *foundation*

# Every malaria parasite and mosquito cell contains DNA

- *Plasmodium falciparum/vivax*
- ~23 million base pairs (A/T/G/C)
- Haploid (one genome copy per cell)
- 14 chromosomes
- ~5,000 genes

- *Anopheles spp.*
- ~225 million base pairs (A/T/G/C)
- Diploid (two genome copies per cell)
- 3 chromosomes
- 12-15,000 genes
